Introduce symbol automatically at the end of connector 5. In-place innovative symbol and connector editor 6. High-speed operation and even faster drawing 7. Exciting UML symbols that adds life to your diagrams and printouts

In a conventional multiple-input multiple-output (MIMO) wireless communications system, multiple data streams are spatially multiplexed using MIMO techniques before being transmitted. In such systems, the data transmitted on the antenna is shown as an array of data points or vectors distributed across multiple antennas with the respective antenna gain and phase values for each data vector. When these gains and phases are constant over time, the signal is said to be transmitted using a uniform array or beam. MIMO systems differ from conventional multiple-input single-output (MISO) or single-input multiple-output (SIMO) systems because the spatial domain model assumes the underlying channels are composed of multiple independent paths that support spatial diversity. As such, the receiver's ability to recover the data streams is improved because it can effectively treat the independent propagation paths as representing a separate transmit antenna. However, the gains and phases of each receive antenna are generally not constant over time, and this can cause signal degradation. Therefore, temporal variation in the gains and phases of the antennas can cause significant degradation to the signal quality. Moreover, in a mobile communications environment, even if the gains and phases of the antennas are allowed to vary with time, there can still be problems due to changes in the antenna configuration (e.g., the number and locations of antennas) over time. For example, a new transmission technique may require an increase in the number of antennas while a previously used technique requires a reduction in the number of antennas. Therefore, to avoid signal degradation due to the use of MIMO systems, the gains and phases of each receive antenna of a MIMO system should preferably be uniform over time. However, the gains and phases of antennas vary over time, and this variation causes signal degradation. Accordingly, a need exists to determine the optimum time varying gain and phase values for each receive antenna to minimize the signal degradation.

## System Requirements For Smart UML Designer:

4K System Requirements: Running Vista, Windows 7, Windows 8, or Windows 10 is required. We recommend at least Windows 8, as Windows 7 and Vista have a number of hardware and driver issues. Dynamics AX 2003, 2006, 2008, 2012, 2013, and 2016 are supported. Unsupported: Windows XP is not supported. Hardware Requirements: The operating system must be Microsoft Windows XP, Vista, Windows 7, or Windows 8. Drivers, files, and storage must be compatible with this operating system.
