AutoCAD

Features Autocad is designed for object-based drawing, in which the objects are constructed based on predefined blocks of a file structure. These blocks are referred to as blocksets and are in most cases the same for each drawing. The blocks, are made up of features, which are either objects themselves, or consist of other features or primitives (which are pre-defined objects such as planes, circles, arcs, lines, etc.) AutoCAD stores information about the blocks in a block library. Blocksets A block is a set of attributes of objects, text, dimensions, etc., and contains information about the objects in the block, such as the layer, which objects in the block, if it is a text block, the height and the text height, and the text font, etc. A block has a unique block type. Blank drawing: Blocksets and master in one file This process works like this: The designer creates blocksets (a collection of blocks) for each drawing. Every drawing has a unique drawing number, and that number is the file name of the drawing file. The first thing that the designer does is add a default block to the drawing, which is referred to as a master block. The designer can then start creating blocksets, which are named after the drawing number. A block cannot be moved or resized by other users after it is created; this is called "lock". Creating and editing blocks Blades Blades are objects that define where and how objects are placed on the page. Line and arc type tools A line can be terminated at a corner or a point, a curved line can be curved by moving its start or end point, and the ends of a line can be connected or split into two lines. An arc is a closed curve, and can be closed, open or filled. The simplest form is a straight line that is joined by a 90 degree angle. More complex arcs include curved lines and spliced arcs, in which the curve is formed by connecting lines that are not parallel. BVH files BVH files are used for constructing a dynamic view of objects in three-dimensional space, without the use of special virtual-reality hardware. Patterns A pattern is a grid (pixels or lines) that defines the view from a particular camera position. The pattern editor is used to define the grid and place the camera. Patterns are added as sublayers to ca3bfb1094
